Client test guide

Contact list cleanup service

Every feature, every test case, and what to expect

What this document is

A walkthrough of every feature and a set of test cases you can run yourself. Each case lists the steps, the result you should see, and a box to tick. If a case fails, note it on the last page - that is the only place we need to look.

Prepared by	Nexora Tech
Version	2.0
Date	03 November 2026
Time to run all tests	About 20 minutes

What is inside

1. What this service does
2. Before you start
3. How to use it, step by step
4. What you get back - the five sheets
5. How each feature works
6. Test cases (18 checks)
7. Known limits
8. Troubleshooting
9. Sign-off

1. What this service does

It takes a messy Excel or CSV contact list and gives you back a clean one, plus a report of everything it changed and everything it removed. Your original file is never modified.

- Removes duplicate contacts - the same person entered more than once.
- Fixes email addresses: trims spaces, lowercases, rejects broken ones.
- Fixes phone numbers: removes +91, dashes, spaces and leading zeros.
- Checks Indian GSTIN, PAN and pincode formats when those columns exist.
- Points out contacts that look like duplicates but were left alone.
- Writes a report you can keep as proof of the work.

What it does not do

- It does not verify that an email inbox exists - only that the format is valid.
- It does not check GSTIN against the government portal - format only.
- It does not invent missing data, merge rows, or edit anything by itself.

2. Before you start

You need	A web browser (Chrome, Edge, Safari or Firefox). Nothing to install.
File types	Excel .xlsx or .xlsm, or .csv. Older .xls files must be re-saved as .xlsx.
File size	Up to 15 MB per file. Up to 20 files in one ZIP, 60 MB total.
Privacy	Files are processed on the machine running the app. Nothing is sent to a third party or stored by us.

Your provider will send you a link. Open it and keep this document beside you while you test.

3. How to use it, step by step

Step 1 - Open the link

The page is titled "Clean my Excel list". You will see an upload box and a short "How it works" card.

Step 2 - Upload your file

Click Upload and choose your Excel or CSV file. For several files at once, put them in a ZIP and upload the ZIP. The page immediately tells you how many rows and columns it read.

Step 3 - Check the columns

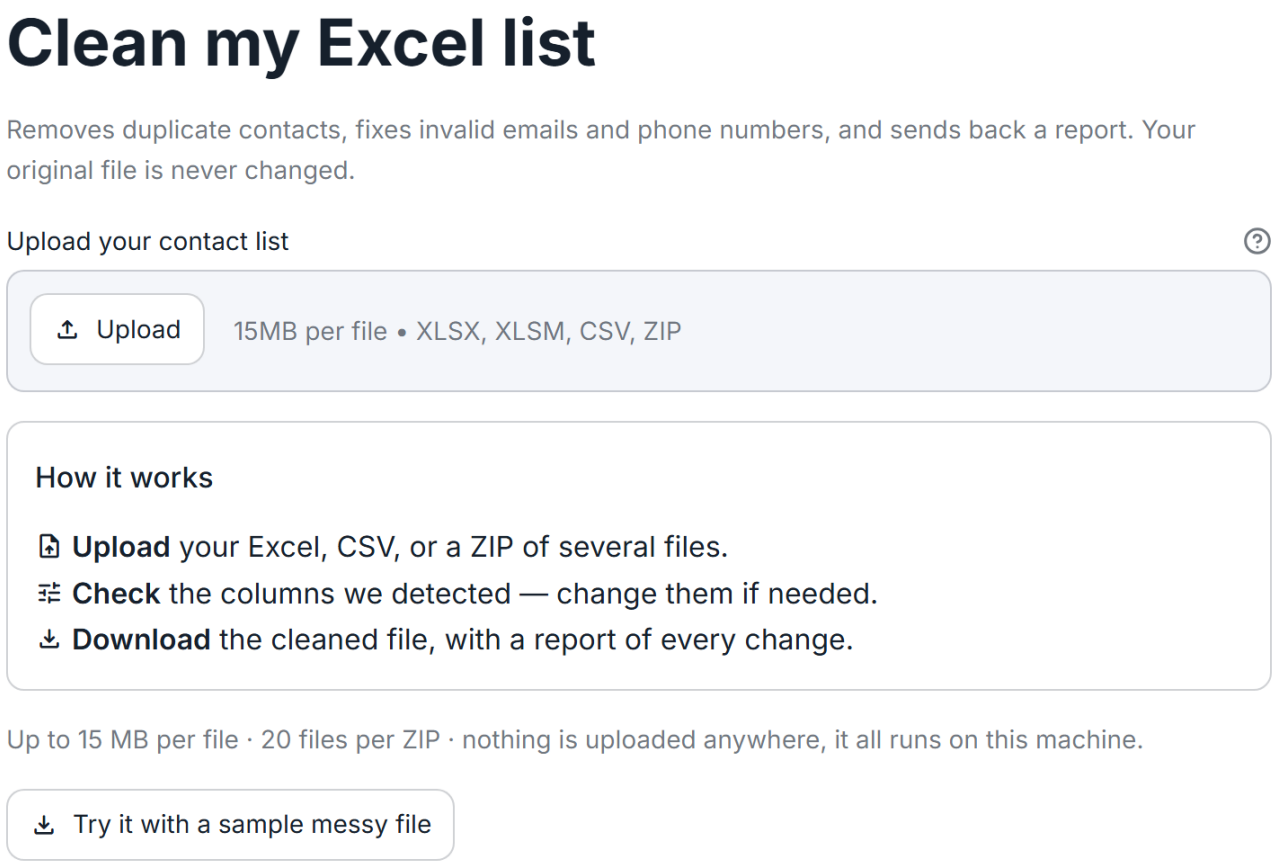

The tool guesses which column holds emails, phone numbers and names by reading the cells. If a guess is wrong, change it from the dropdown. This is the only step that needs your attention.

Step 4 - Click "Clean this file"

Nothing is downloaded yet. The page shows you what it found: clean rows, duplicates, bad emails, bad phones. You can open the lists before deciding.

Step 5 - Download

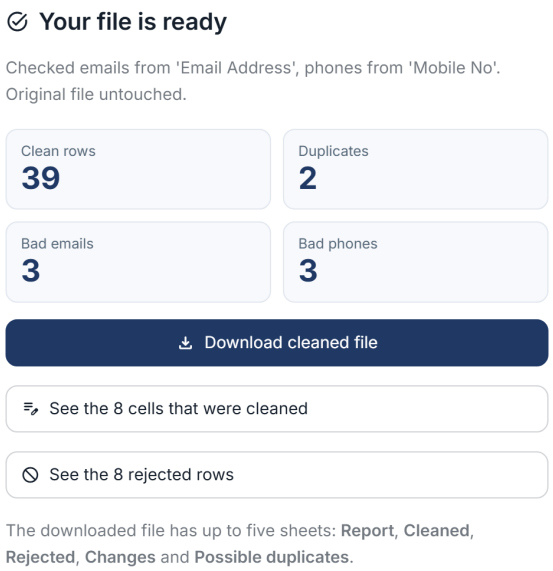

Click "Download cleaned file". You get one Excel workbook with the clean rows and a full report. Your original file is untouched.

The page you land on.

4. What you get back - the five sheets

Sheet	What is in it
Report	One screen: rows read, kept and rejected; duplicates removed; invalid emails, phones and GSTIN/PAN/pincodes; how many cells were cleaned; why rows were rejected. Start here.
Cleaned	The rows that passed every check, with emails and phone numbers normalised. This is the list you import or upload to your CRM.
Rejected	Every row that was removed, with its original row number and the reason. Nothing is deleted silently.
Changes	Every cell that was altered, shown as Before and After, with the kind of fix. This is your proof that the work was done.
Possible duplicates	Pairs that look like the same person but were NOT removed - for example "Rahul Sharma" and "Rahul S.". You decide. This sheet appears only when such a pair is found.

The result screen, on a phone or a laptop.

How duplicates are decided

Two rows are treated as duplicates if their email address matches, or their phone number matches - after normalising both. Values are cleaned before comparing, so all of these count as the same person:

Name	Email	Phone
Rahul Sharma	rahul.sharma@gmail.com	9876543210
Rahul S	RAHUL.SHARMA@GMAIL.COM	+91 98765 43210
Rahul	rahul.sharma@gmail.com	09876543210

The first row is kept; the others are listed on the Rejected sheet as duplicates of it.

5. How each feature works

Validation rules

Field	Accepted	Rejected
Email	One @, a domain, a real ending: name@company.com	karan@gmail, divya@@gmail.com, arjun@
Phone (India)	9876543210, +91 98765 43210, 09876543210, 98765-43210	12345, 1234567890, 98765abcde
Phone (US)	(415) 555-2671, +1 415 555 2671	Anything shorter or with letters
GSTIN	27AAPFU0939F1ZV (15 characters, valid state code)	00AAPFU0939F1ZV, 27AAPFU0939F1Z
PAN	AAPFU0939F	AAPF0939F, 1234567890
Pincode	400001, 400 001	040001, 40001

Options on the page

Email / Phone column	Which column to check. Guessed automatically; change it if wrong.
Columns that must never be empty	Rows missing these are moved to Rejected. Leave empty to allow blanks.
Phone numbers are from	India, United States, or Any country. Changes the validation rule.
Write phone numbers as	Local (9876543210), International (+919876543210), or Digits only.
Indian business fields	Optional GSTIN, PAN and pincode columns. Checked when selected.
Only report duplicates	When ticked, duplicates are listed but kept instead of removed.
My column headers are not on row 1	For files with a title or logo row above the headers. Set the header row number.

6. Test cases

Run these in order. Every expected number below comes from the sample file the page offers, so your results should match exactly. Tick Pass or Fail for each.

A. Getting started

#	What to do	What you should see	Pass	Fail
A1	Open the link you were sent.	Page titled "Clean my Excel list", an upload box, and a "How it works" card.		
A2	Click "Try it with a sample messy file".	A file named sample_dirty.xlsx downloads.		

B. Upload and column detection

#	What to do	What you should see	Pass	Fail
B1	Upload sample_dirty.xlsx.	Green message: Read 49 rows and 5 columns. Email column shows Email Address, phone shows Mobile No.		
B2	Open "Look at the first rows".	Five rows with their headers, starting with Rahul Sharma.		

C. Cleaning and the output file

#	What to do	What you should see	Pass	Fail
C1	Click "Clean this file".	Clean rows 39, Duplicates 2, Bad emails 3, Bad phones 3.		
C2	Click "Download cleaned file".	An .xlsx file downloads and opens in Excel.		
C3	Look at the tabs at the bottom.	Report, Cleaned, Rejected, Changes. No Possible duplicates tab for this file.		
C4	Open the Report sheet.	Rows read 49, kept 39, rejected 8, duplicates 2, blank rows 2, cells cleaned 8.		
C5	Open the Rejected sheet.	Exactly 8 rows, each with a reason such as invalid email or duplicate of row 2.		
C6	Open the Changes sheet.	8 rows showing Before and After, e.g. +91 98765 43211 becomes 9876543211.		
C7	Open your original sample_dirty.xlsx.	Unchanged - still 49 rows and the same messy values.		

D. Options

#	What to do	What you should see	Pass	Fail
D1	Clean the sample with phone format "International".	Mobile numbers in the Cleaned sheet start with +91.		
D2	Tick "Only report duplicates" and clean again.	Duplicates 2 is still reported, but the Cleaned sheet keeps all 41 usable rows.		
D3	Add Name to "Columns that must never be empty" using your own file with an empty name.	That row appears on Rejected as missing required field: Name.		

E. Indian business fields

#	What to do	What you should see	Pass	Fail
E1	Upload a file with a GSTIN column containing one bad value.	GSTIN is detected automatically; the bad row is Rejected as invalid GSTIN.		
E2	Open "Indian business fields" on the same file.	The GSTIN dropdown is already set to your GSTIN column.		

F. Batch mode (a ZIP of files)

#	What to do	What you should see	Pass	Fail
F1	Put 2 or 3 spreadsheets in a ZIP and upload it.	Blue note says Batch mode; a "Clean all files" button appears.		
F2	Click "Clean all files".	Files cleaned shows 2 / 2 (or 3 / 3) and a table lists each file separately.		
F3	Click "Download all ... cleaned files".	A ZIP downloads containing one workbook per input file plus batch_summary.csv.		

G. Near-duplicates

#	What to do	What you should see	Pass	Fail
G1	Upload a file with Rahul Sharma and Rahul S. as separate rows.	"1 possible duplicates to review" appears; no row is removed.		
G2	Open the Possible duplicates sheet.	Both rows listed with a score of about 92 and the reason.		

H. Edge cases

#	What to do	What you should see	Pass	Fail
H1	Try to upload a PDF or Word file.	The page refuses it. Nothing crashes.		
H2	Upload a CSV with a stray quote, e.g. "Rahul" Sharma.	It either cleans normally or shows one plain sentence with a fix. No error trace.		

Batch mode at a glance

Clean my Excel list

Removes duplicate contacts, fixes invalid emails and phone numbers, and sends back a report. Your original file is never changed.

Upload your contact list

tmp_batch.zip
5.7KB

Batch mode. Every `.xlsx` and `.csv` inside the ZIP is cleaned with the same rules — up to 20 files. Columns are detected per file, so folders with different layouts all work.

Phone numbers are from: India

Write phone numbers as: Local

Clean all files

Batch finished

Files cleaned	Rows kept	Rows rejected	Cells cleaned
2 / 2	6	4	6

File	Kept	Rejected	Duplicates	Bad emails	Bad phones	Cells cleaned
february-leads.xlsx	3	1	0	0	1	3
january-leads.csv	3	3	1	1	1	3

Download all 2 cleaned files

The ZIP contains one workbook per input file, plus **batch_summary.csv** with the same numbers shown above.

One ZIP in, one ZIP out. Each file is cleaned with the same rules and listed separately.

7. Known limits

- Email checking is format only. A well-formed address that does not exist will pass.
- GSTIN checking is format only. The check digit is not recalculated and nothing is looked up on the GST portal.
- Near-duplicate matching understands English and Latin names. Names in other scripts are not matched.
- Very common first-three-letter groups are skipped in near-duplicate matching to keep large files fast.
- Files over 15 MB, or more than 20 files in one ZIP, are refused. Split them and run again.
- Legacy .xls files must be re-saved as .xlsx first.

8. Troubleshooting

Symptom	What to do
The page will not open	Check the link. If it still fails, tell your provider - the app may need restarting.
"That file could not be read"	Open the file in Excel and use File > Save As > Excel Workbook (.xlsx), then upload again.
A column was not detected	Pick it manually from the dropdown. The list shows every column in your file.
Phone numbers look wrong	Check "Phone numbers are from". Choosing the wrong country rejects good numbers.
Too many rows rejected	Look at the Rejected sheet. Usually the wrong column was chosen, or a required column was set too strict.
Numbers show as 9.87654E+09	The cell is numeric, not text. Format that column as Text in your file before uploading.

9. Sign-off

When all the cases above pass, sign below. If any case failed, write the case number and what happened - that is all that is needed to fix it.
